Title –Intelligens WW Breather Maint'ce

Made By: AB 21/11/17

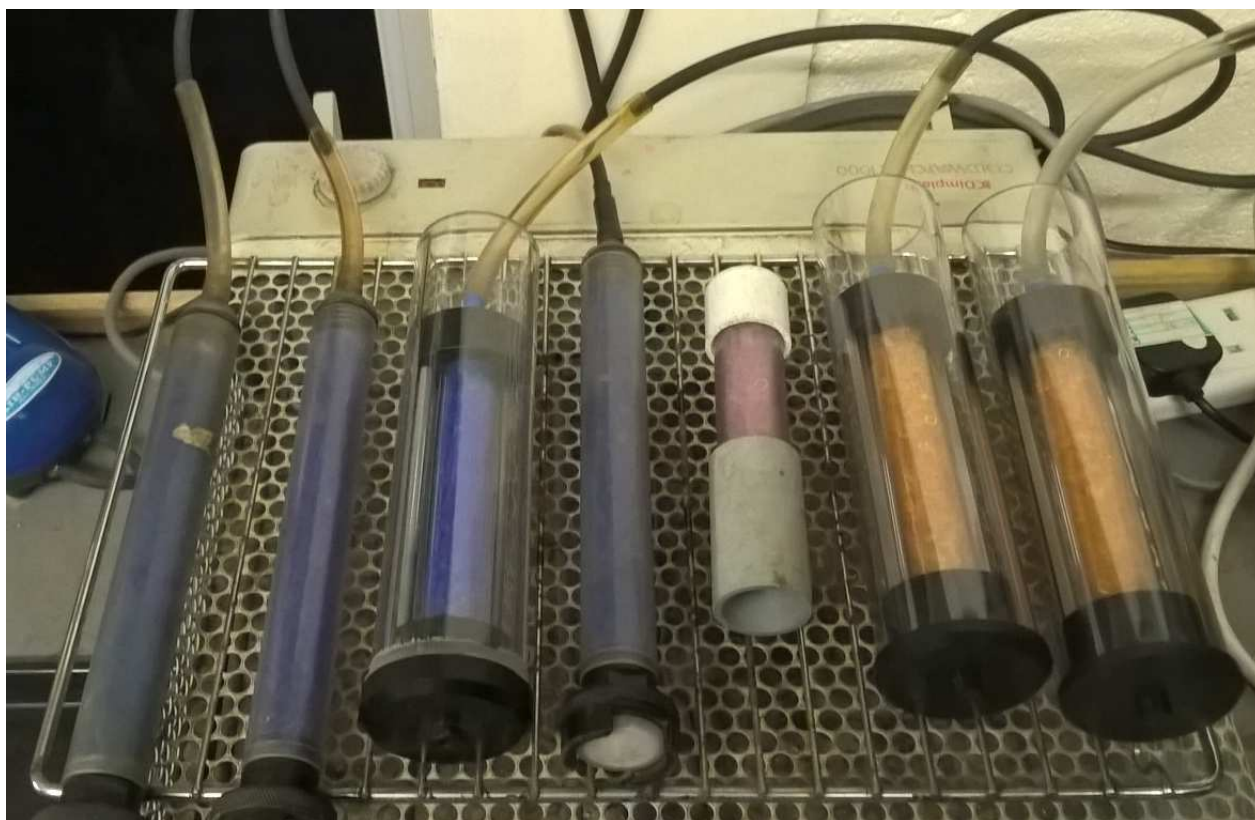

(Issue 1)

Intelligens Waste Water breather maintenance

It is essential to carry out routine maintenance on the equipment Breathers to ensure continued accurate data.

The crystals should be swapped as soon as colour change is seen in order to protect the breather tube and pressure sensor. Unfortunately this can be required every week at some sites.

The Gore-Tex filter system should be swapped out and the used ones brought back for cleaning and replacement of the crystals as a workshop procedure. What works well is using a fish tank air pump. Place the breather tube with crystals on a heated surface and blow air through the system until crystals turn yellow. This proves the crystals and Gore-Tex filter system are working correctly, fully operational and not blocked.
