Title – Setting timezone using IDT

(Issue 1)

How to set a logger's time to the timezone using IDT

In IDT software the below options are available in 'Setting's -

- Use IDT timezone this will use whatever UTC time offset you configure in the IDT software see later
- Use Logger Timezone this will use whatever time has previously been set in the logger (this is the default setting it maintains the time set in the logger even when your PC time changes for winter/summer changes)
- Use PC time this will change with Summer/Winter time changes so should be used with caution.

Then when you go to set up the logger there is a UTC drop down which enables you to set the time relative to the time zone you are in against UTC, and this will be uploaded to the logger.
