Pressure transient logger Data download issues using IDT

Logger memory -

    4GBytes at 100hZ is around 300 days.

When downloading data there is a warning in the IDT that only 2 days of data is available -

    The 2 day limit was added because of the time it takes to download.
    To circumvent this, in the IDT, download the archive data and select the point of interest
    from the graph, right click and choose the download transient data option .

When you select stop the logger, IDT prompts that unsent data will be erased.

    The unsent data warning refers to the archive file.
