How many loggers can a Radwin desktop modem handle

A single desk top modem can handle data from more than two thousand SMS loggers – you can set the call in time hour (around 200-300 loggers per hour) but you cannot set the minute the logger calls in because the exact call in time is related to a part of the logger firmware which decides its call in time as a function of the logger serial number. The desk top modem will queue the messages coming in as well to ensure that all data is received.

If you have 350 loggers then I would stagger the call in hour settings to say 100 per hour.
